REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

6 Station not equipped with a recording gage.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

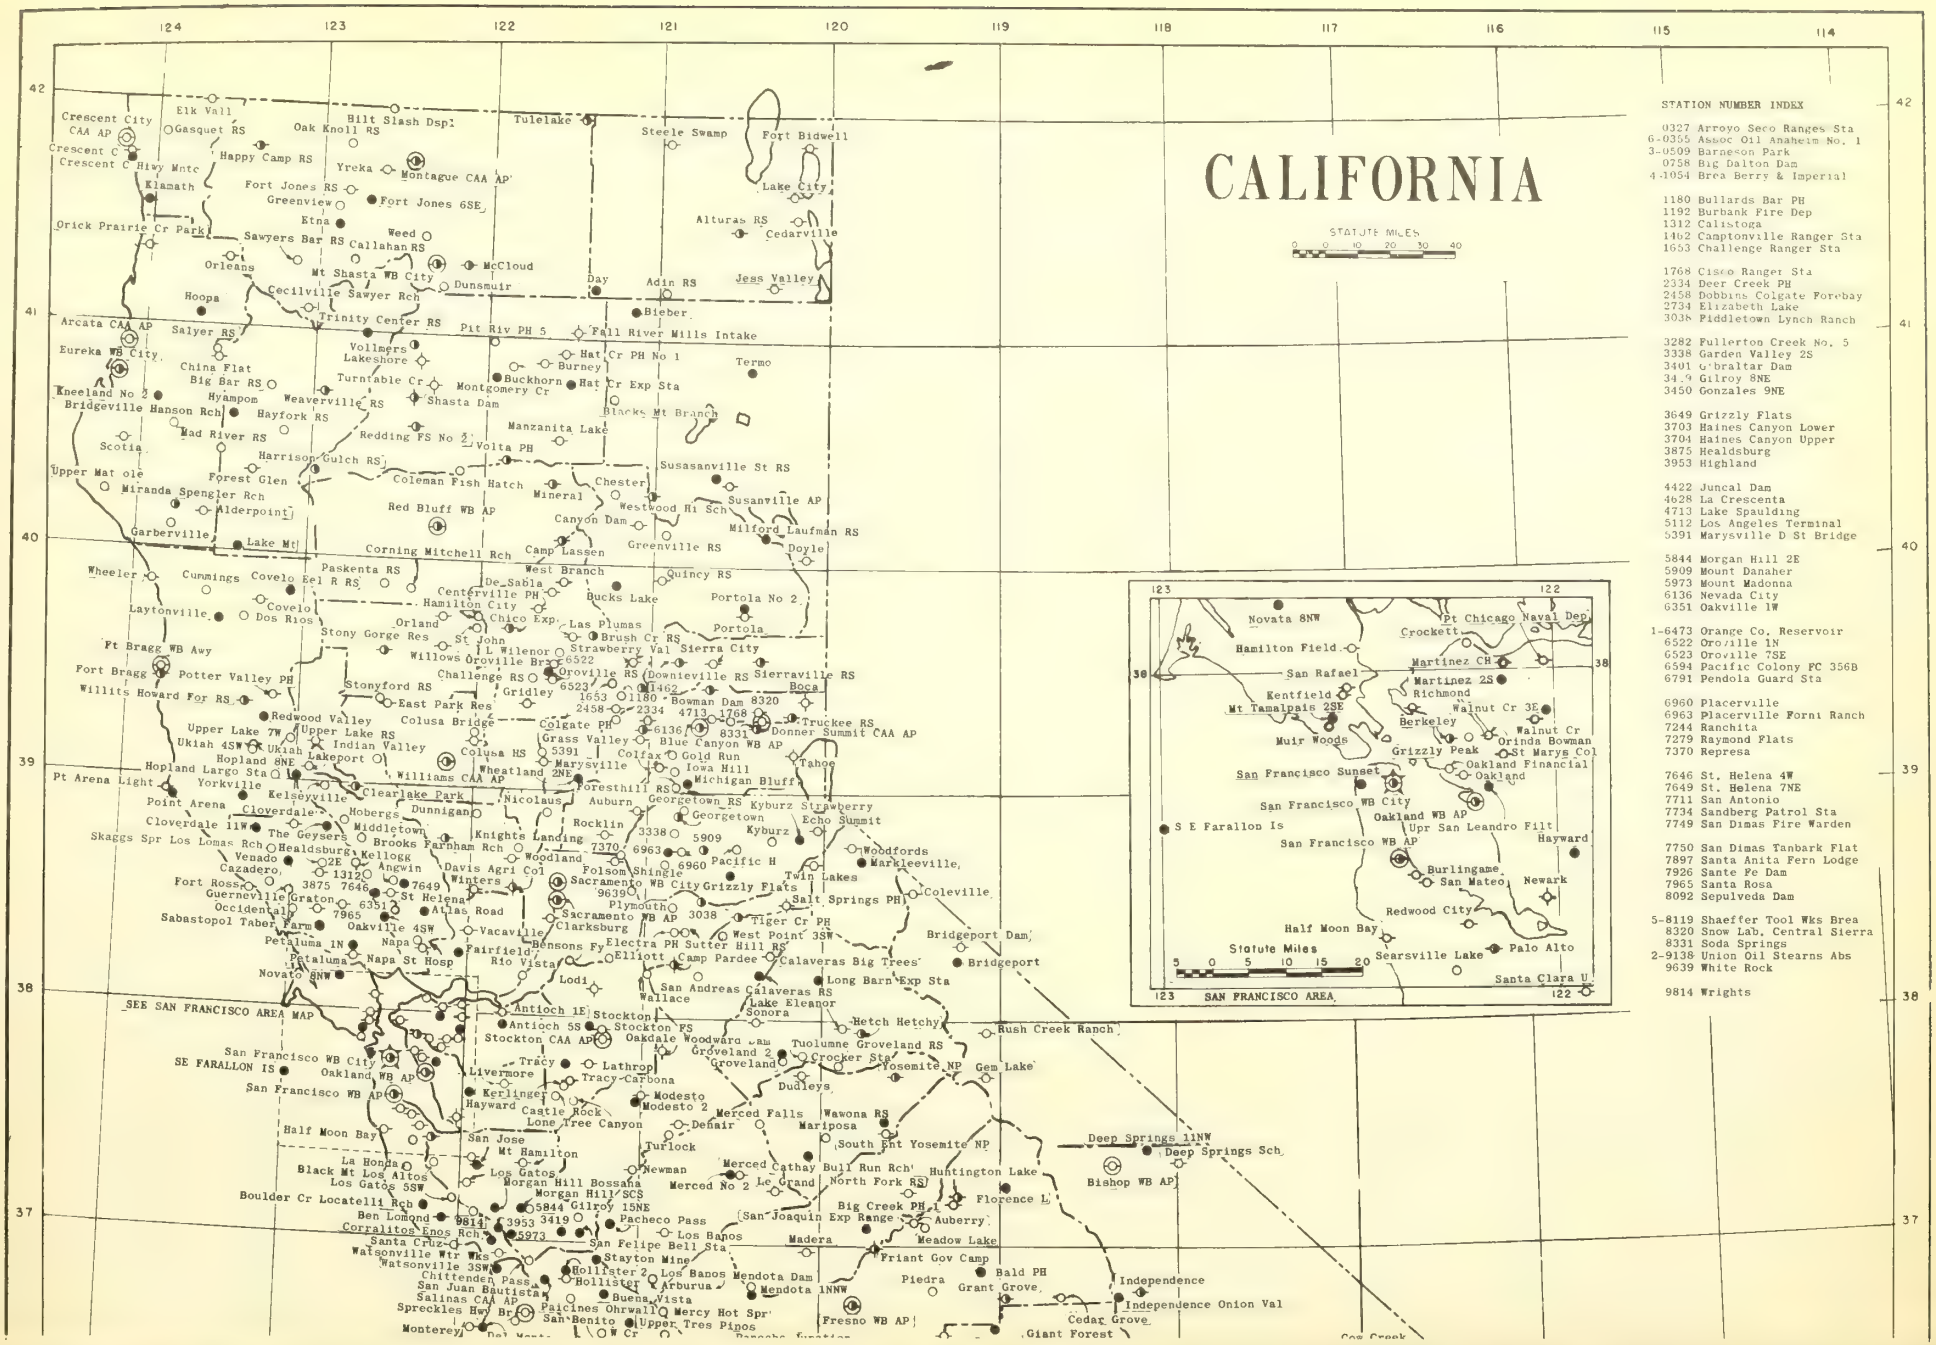
M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.



V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CORRECTED DATA WILL BE FOUND ON PAGE 225.

SAN FRANCISCO: 1951

CALIFORNIA - JULY 1951

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 303 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 75.6° or 0.3° below the weighted mean. The unweighted average temperature based on the same 303 stations was 72.8° or 0.8° below the unweighted mean. Cow Creek in Death Valley reported the highest temperature for the State with the maximum of 125° on the 18th. Boca in Nevada County recorded the lowest temperature, 23°, on the 4th.

The average precipitation for the State based on 309 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.08 inch or 0.03 inch below the weighted mean. The unweighted average based on the same 309 stations was 0.07 inch or 0.02 inch below the unweighted mean. Based on 641 stations listed in Table 3 the average precipitation was 0.08 inch or 0.01 inch below the unweighted mean. Mill Creek Intake in San Bernardino County reported the greatest monthly total precipitation, 3.39 inches. Big Bear Lake Dam, also in San Bernardino County, recorded the greatest daily total precipitation, 2.10 inches, on the 19th. 530 stations scattered throughout the State reported no measurable precipitation.

The lack of substantial precipitation in the north coastal area generally favored haying operations but contributed to increasing irrigation water requirements. Despite the light precipitation potatoes and root crops made satisfactory progress. Home vegetable gardens and truck gardens progressed satisfactorily, but daily irrigation was necessary.

Generally cool weather in the central coastal area resulted in slow ripening of fruits and development of other crops.

Cool weather in the Upper Sacramento Valley during the first week slowed ripening of peaches somewhat. Moderate temperatures during the last three weeks were nearly ideal for all crops. Peaches advanced steadily, and prunes were benefited by the warm weather.

Well below normal temperatures in the Lower Sacramento Valley during the first half of the month adversely affected crops, particularly rice, tomatoes, apricots, and pears. Winds were generally too strong for effective dusting and spraying operations. High temperatures during the third week benefited beans, tomatoes, rice, and pears, but contributed to some sunscald on grapes. Generally light winds on most days made widespread dusting and spraying possible during the last half of the month.

Below normal temperatures in the Lower San Joaquin Valley during the first half of the month contributed to the development of some wilt in cotton and a delay in the planting of sorghums. The unusually low night time temperatures contributed to an abundant supply of dew which favored alfalfa cutting and baling. Winds were generally too strong for effective crop dusting operations. The minimum temperature of 54° recorded at Fresno on the 4th equaled the lowest temperature on record for that date established in 1910 and approached the record low for Fresno for the month of July, 50°, established in 1901. High temperatures during the third week favored development of crops. In some instances grapes which had been sulphured before the hot spell sustained some slight "burn". Although winds were light enough to permit some crop dusting operations, temperatures were generally too high for dusting for mildew and spraying for Pacific mite in vineyards. Low relative humidities accompanying the relatively high minimum temperatures contributed to a nearly complete lack of dew and resulted in delays in alfalfa cutting and baling operations. Weather during the last week was cool but generally favorable for crops. Winds were ideal for dusting operations.

Although temperatures in the Upper San Joaquin Valley were generally below normal, crops developed satisfactorily. Hot weather during the third week resulted in increased irrigation water requirements and favored rapid development of crops.

Weather in the Santa Maria area was generally favorable for crops; however, foggy mornings contributed to considerable slime formation on lettuce.

Cool, cloudy weather in the Los Angeles area during the first part of the first week generally favored truck crops. Warm weather during the latter part of the first week contributed to more rapid ripening of deciduous fruits but resulted in some splitting of apricots. Pest control operations in citrus groves were interrupted due to high day time temperatures. Irrigation was increased. Hot, humid weather during the last half of the month was generally favorable for most crops, but made much additional irrigation necessary. Pest control operations were generally curtailed due to the high temperatures.

Seasonable weather prevailed in the San Diego area except for the hot spell which occurred between the 17th and 19th when new records were established for high temperatures on these dates at San Diego.

Generally clear, hot weather prevailed in the Imperial Valley as harvesting operations progressed.

REFERENCE NOTES

For station Latitude, Longitude, Elevation and etc., see Station Index, Climatological Data, California

- \- No record.
- * Amounts included in following measurement.
- // Gage is equipped with a windshield.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall
- R Station equipped with recording gage only.
- T Trace, an amount too small to measure.
- V Includes total for previous month.
- Z Station equipped with both recording and non-recording rain gages, amounts printed are from non-recording gage only

DATA FOR THE PERIOD BEGINNING WITH OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ON AN AREAL BASIS AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

6 Station not equipped with a recording gage.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

SAN FRANCISCO: 1951

CALIFORNIA - AUGUST 1951

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 307 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 73.7° or 1.1° below the weighted mean. The unweighted average temperature based on the same 307 stations was 71.5° or 1.1° below the unweighted mean. Cow Creek and Greenland Ranch in Death Valley reported the highest daily temperature of 121° on the 17th and 19th respectively. Boca, at an elevation of 5535 feet in Nevada County, recorded the lowest daily temperature, 22° on the 12th.

The average precipitation for the State based on 313 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.39 inch or 0.22 inch above the weighted mean. The unweighted average based on the same 313 stations was 0.29 inch or 0.16 inch above the unweighted mean. Based on 659 stations listed in Table 3 the unweighted average was 0.23 inch or 0.10 inch above the unweighted mean. Blythe in Riverside County reported the greatest monthly total precipitation, 6.00 inches. Parker Reservoir in San Bernardino County recorded the greatest daily total, 3.05 inches, on the 29th. 321 stations, mostly in the Central Valley and Central Coastal area, reported no measurable precipitation, and 243 of these 321 stations reported no precipitation whatsoever.

Irrigation was necessary for most crops in the north coastal area due to the continued lack of rainfall. Pastures and ranges were reported extremely dry. Root crops, however, continued generally in satisfactory condition despite the lack of rainfall.

Cool weather in the Central Coastal area resulted in slow development of truck crops and fruits. Tomatoes were reported later than usual. Grapes developed satisfactorily but were also late. A thunderstorm in San Francisco on the 21st with cloud to cloud and cloud to ground lightning resulted in disrupted electric power and light services and transportation delays in various parts of the city. The total precipitation for August for San Francisco, 0.43 inch, brought the accumulated total since July 1, 1951 to 0.44 inch. This was the greatest accumulated total for that period since records began in 1849 at that station.

Weather in the Upper Sacramento Valley was generally favorable for crops and farming operations. High temperatures accompanied by low relative humidities on some days during the last half of the month contributed to an increase in red spider activity.

During the first decade in the Lower Sacramento Valley warm afternoons were favorable for rice, tomatoes, and sugar beets, but cool nights were unfavorable for ripening tomatoes. Much above normal temperatures during the second decade were generally beneficial to crops particularly rice and tomatoes but contributed to some damage to grapes, walnuts, and peaches. Cooler weather during the last decade resulted in a slower ripening of peaches and tomatoes. At the end of the month rice was reported about two weeks behind last year in stage of development due to the cool weather of June, July, and August.

Below normal temperatures in the Lower San Joaquin Valley on about 20 days slowed the development of grapes and cotton. Above normal temperatures during the third week generally benefited all crops. Figs advanced rapidly, grapes sugared satisfactorily, and cut peaches on trays dried fast. High nighttime relative humidities during the last week favored alfalfa baling operations.

In the Upper San Joaquin Valley weather was generally favorable for crops and farming operations. Above normal temperatures during the third week resulted in rapid opening of cotton bolls in some early planted fields and in some increase in irrigation water requirements.

Weather in the Santa Maria area was generally favorable for crops and farming operations except for foggy mornings on many days which were not beneficial to lettuce.

Hot weather during the first week in the Los Angeles area was helpful for maturing melons and peaches but contributed to a light to moderate drop of new citrus fruit in some localities and some sunscald on walnuts and tomatoes. There was little or no damage sustained by vegetation except where water shortage in combination with the heat resulted in adverse effects in some citrus groves. Warm weather during the third week favored growth of vegetation and harvesting operations. The monthly total precipitation recorded at Los Angeles, 0.15 inch, was the fifth greatest of record for August at that station.

In the San Diego area weather was generally favorable for crops and harvesting and spraying operations. Heavy rains on the 28th ended a four month dry period in San Diego County. The total of 0.85 inch of precipitation for San Diego for August was exceeded only three times since records began in 1850, as follows: 1.36 inches in 1853; 1.95 inches in 1873; and 0.87 inch in 1945.

Hot, humid weather in the Imperial Valley during the greater portion of the month was not favorable for farm work. Light to heavy thunderstorms during the last week brought light to heavy rains to the Imperial and Coachella Valleys. Many roads were washed out in Imperial County. Rains also badly damaged the Imperial Irrigation District's canal system. See Comparative Data for Selected Stations on Page 301.

DATA FOR THE PERIOD BEGINNING WITH OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ON AN AREAL BASIS AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

6 Station not equipped with a recording gage.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CLIMATOLOGICAL DATA

CALIFORNIA

SEPTEMBER 1951
Volume LV No. 9

Beginning with the October, 1951, issue of Climatological Data, Table 4, Hourly Precipitation, will be discontinued due to curtailment of the funds necessary for the processing and publication of these data.

SAN FRANCISCO: 1951

CALIFORNIA - SEPTEMBER 1951

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 311 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 71.8° or 2.3° above the weighted mean. The unweighted average based on the same 311 stations was 69.9° or 2.1° above the unweighted mean. The highest temperature for the State, 115°, was recorded at Greenland Ranch on the 9th and 15th, Cow Creek on the 9th, 10th, 11th, 15th, and 16th, and at Palm Springs on the 12th. Boca in Nevada County reported the lowest temperature on the 6th, 26th, and 27th; 21°.

The average precipitation for the State based on 315 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.12 inch or 0.28 inch below the weighted mean. The unweighted average based on the same 315 stations was 0.11 inch or 0.28 inch below the unweighted mean. Based on 664 stations listed in Table 3 the unweighted average was 0.10 inch or 0.29 inch below the unweighted mean. Crescent City CAA AP in Del Norte County reported the greatest monthly total precipitation, 2.16 inches, and also the greatest daily precipitation amount, 1.58 inches, on the 30th. Two hundred eighty-eight (288) stations reported a total precipitation of none and 72 stations reported a trace.

The lack of adequate sunshine in the north coastal area was unfavorable for ripening of some tomatoes. Local truck crops were not too successful due to the lack of adequate sunshine and moisture.

In the central coastal area weather was generally favorable for harvesting of crops.

Cool weather in the Upper Sacramento Valley hindered prune drying operations somewhat during the first week but was not detrimental to other activities. Warmer weather and lower relative humidities during the last three weeks aided fruit drying but increased irrigation water requirements in irrigated pastures and for truck crops. The highest temperature of the year at Red Bluff, 110°, was recorded on the 9th.

Cool weather in the Lower Sacramento Valley during the first week was favorable for nut crops, coloring of Tokay grapes, and slow ripening of peaches but unfavorable in some respects, delaying cannery tomatoes and maturing of rice. Warmer weather during the second and third weeks was beneficial to crops. Tomatoes ripened more rapidly and prune drying progressed satisfactorily due to higher temperatures. Drained rice fields matured and dried.

Cool days in the Lower San Joaquin Valley during the first week were unfavorable for sugaring of grapes on the vines, and cool nights were unfavorable for ripening of figs. Cantaloup harvesting was slowed due to the cool weather. High night-time relative humidities benefited baling of alfalfa hay. Warmer weather during the last three weeks speeded drying of grapes and resulted in an increased rate of opening of cotton bolls. Early morning dews favored hay baling and some cotton defoliation operations. Above normal temperatures with near maximum possible sunshine and total lack of precipitation made September an ideal month for drying raisins and maturing cotton. The twenty days from the 8th through the 27th established a new record at Fresno for the greatest number of consecutive days with above normal daily maximum temperatures during September.

Weather in the Upper San Joaquin Valley was generally favorable for crops and harvesting activities. The highest temperature of the summer at Bakersfield, 107°, was reported on the 16th. As of the end of the month no measurable precipitation had occurred at Bakersfield since May 6, 1951.

Weather in the Santa Maria area was generally favorable for most crops, but fog was somewhat detrimental to lettuce which was being harvested.

Cool weather in the Los Angeles area during the first decade reduced irrigation water requirements somewhat. Warmer weather during the second decade was generally favorable for growing and maturing crops except where water shortages existed. Some pest control operations were interrupted by high temperatures and low relative humidities. Hot weather generally accelerated maturation of grapes, walnuts, and other late deciduous fruits.

One noteworthy feature of the weather in the San Diego area was the large number of days with fog. Eight days with fog were recorded compared to the average of only two days for September.

Weather in the Imperial Valley was quite warm but not unfavorable for planting and harvesting activities.

DATA FOR THE PERIOD BEGINNING WITH OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ON AN AREAL BASIS AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

See reference notes following Station Index

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

6 Station not equipped with a recording gage.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CLIMATOLOGICAL DATA

CALIFORNIA

OCTOBER 1951
Volume LV No. 10

Beginning with the October, 1951, issue of Climatological Data, Table 4, Hourly Precipitation, will be discontinued due to curtailment of the funds necessary for the processing and publication of these data.

SAN FRANCISCO: 1951

CALIFORNIA - OCTOBER 1951

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 308 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 60.5° or 0.7° below the weighted mean. The unweighted average temperature based on the same 308 stations was 60.0° or 0.3° below the unweighted mean. The highest temperature, 110°, was recorded at Palm Springs on the 11th. Boca at an elevation of 5535 feet in Nevada County reported the lowest temperature, 10°,on the 22nd.

The average precipitation for the State based on 311 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 1.81 inches or 0.72 inch above the weighted mean. The unweighted average based on the same 311 stations was 1.91 inches or 0.70 inch above the unweighted mean. Based on 534 stations listed in Table 3 the unweighted average was 1.96 inches or 0.75 inch above the unweighted mean. Elk Valley in Del Norte County reported the greatest monthly total precipitation, 12.68 inches. Lake Spaulding at an elevation of 5075 feet in Nevada County recorded the greatest daily precipitation amount on the 24th, 4.23 inches. Eight stations recorded only traces or no precipitation.

Although rains in the north coastal area interrupted or slowed field operations during the month, potato harvesting was generally completed by the end of the month.

Above normal temperatures in the central coastal area during the first half of the month were generally favorable for crops and harvesting operations. Rains on the 23rd, 24th, and 25th were generally beneficial but resulted in some damage to some ripe grapes and tomatoes.

Rains during the period September 30 through October 2 caught several prune crops partially on the trees; however, little damage was sustained. Some Ladino clover was cut and partially threshed when the rains started. Drying winds following the rains were beneficial to the Ladino clover harvesting operations. From the 3rd to the 22nd the weather was generally favorable for crops and harvesting operations. Rains on the 23rd and 24th were very beneficial to ranges, irrigated pastures, and some early planted grains, but interrupted olive picking to some extent. Soils were generally wetted sufficiently to permit large scale tilling and planting.

Rains during the first two days in the lower Sacramento Valley had little effect on crops and farming operations. Drying, north winds on most days from the 3rd through the 22nd contributed to drying of rice fields and bean fields and favored harvesting activities. The lack of early rains permitted digging of over half of the sugar beets. Rains on the 23rd, 24th, and 25th interrupted bean, sugar beet, and rice harvesting activities but benefited grasses and other forage crops. Canning tomato harvesting ended with only small losses due to rains. Alfalfa and clover seed harvesting sustained some slight losses.

Weather in the lower San Joaquin Valley was generally favorable for all agricultural activities. Sufficient dews favored alfalfa cutting and baling and some cotton defoliation operations during the first week. The maximum temperature of 98° at Fresno on the 8th equaled the highest temperature ever recorded on this date for this station. Above normal temperatures during the first half of the month resulted in ideal conditions for concluding the fruit harvest. During the third week persistent light dews or complete lack of morning dews hindered some cotton defoliation operations. Generally, weather was quite favorable for cotton harvesting. Rain on the 24th ended a 127 day period without precipitation in the Fresno area. Cotton picking was delayed several days but cotton defoliation activities benefited by the rains. Scattered light frosts in some lower, colder districts were helpful in defoliation of some cotton plants during the last week.

Weather in the upper San Joaquin Valley generally favored all crops and harvesting operations. Rains on the 24th, however, resulted in some slight damage to cotton in some places and interrupted cotton picking, alfalfa seed harvesting, and tomato picking.

In the Santa Maria area weather was generally favorable for crops and harvesting operations. Rains on the 24th and 25th resulted in only slight damage to dry beans and did not generally slow harvesting operations to any great extent.

Hot, dry weather in the Los Angeles area during the first three weeks increased irrigation water requirements, interrupted pest control operations, and increased fire hazards. Average daily temperatures on the 7th, 8th, and 9th were from 12° to 14° above normal at Los Angeles. Lima bean harvesting continued 24 hours per day in some districts to prevent loss of beans from popping of pods due to hot, dry weather. Some softening of mature citrus was sustained due to hot, dry weather. Rains on the 24th and 25th benefited truck crops and pastures. Water shortages remained critical in some districts.

Temperatures in the San Diego area were unusually high on the 7th, 8th, and 9th and irrigation water requirements were increased. Pest control operations were interrupted due to the high temperatures. Generally weather favored crops and harvesting activities. Substantial rainfall on the 24th and 25th was favorable for fall plowing but unfavorable for late tomatoes.

Weather in the Imperial Valley generally favored planting and harvesting activities.

STATIONS NOT FOLLOWED BY A TABLE NUMBER REFERENCE IN THE STATION INDEX ARE NOT PUBLISHED IN CLIMATOLOGICAL DATA BEGINNING WITH OCTOBER 1951, RECORDS.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station nave been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

WEATHER SUMMARY

The average temperature for the State based on 297 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 51.4° or 0.6° below the weighted mean. The unweighted average based on the same 297 stations was 51.9° or 0.1° above the unweighted mean. The highest temperature, 94°, was recorded at Indio U.S. Date Garden on the 6th. The lowest temperature, -9°, was recorded at Big Bear Lake Dam on the 26th.

The average precipitation for the State based on 298 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 3.27 inches or 1.23 inches above the weighted mean. The unweighted average based on the same 298 stations was 3.49 inches or 1.24 inches above the unweighted mean. Based on 483 stations listed in Table 3, the unweighted average was 3.75 inches or 1.50 inches above the unweighted mean. The greatest monthly total precipitation, 19.74 inches, was reported from Upper Mattole in Humboldt County. The greatest daily total, 4.85 inches, occurred at Vollmers in Shasta County on the 20th. Only three stations in the Southeastern Interior reported no precipitation.

Twin Lakes at an elevation of 7920 feet in Alpine County reported the greatest monthly total snowfall, 61.0 inches. Soda Springs at 6752 feet in Nevada County reported 59.0 inches.

The absence of precipitation in the north coastal area during the first week permitted some soil cultivating and some grain planting activities. Abundant rains during the last three weeks were beneficial to pastures and ranges.

Above normal temperatures and above normal precipitation in the central coastal area favored truck crops and range and pasture grasses. Rains during the third week interrupted some harvesting operations.

Above normal temperatures together with a lack of precipitation in the Upper Sacramento Valley during the first week favored most crops and farming operations. Soils dried sufficiently from previous rains to permit resumption of plowing operations. Above normal rainfall during the last three weeks benefited grains and range grasses. Killing frosts in the last week damaged late tomatoes and retarded growth of alfalfa. Movement of cattle from summer ranges in mountains to valley ranges continued.

Warm afternoons in the Lower Sacramento Valley aided the drying of rice, clover, and alfalfa so that harvesting operations could be resumed. The absence of freezing weather in foothill and valley pastures contributed to excellent growth in grasses. Rains during the month benefited pastures and ranges. Very small amounts of rice and beans were left unharvested as a result of the rains. Thunderstorms were reported on the 19th and 21st. Hail fell on the 21st in scattered districts of Sacramento. Outlying districts reported frosts on the 16th, 17th, 24th, and 25th. In the mountains the month ended with a snow pack of 26 inches at Norden and at the 5000-foot level 11 inches remained.

In the Lower San Joaquin Valley light winds together with good dew conditions favored some cotton defoliation and haying operations. Weather was generally ideal for all crops except range grasses which were in need of more moisture. Rains from the 19th to 21st slowed cotton harvesting but benefited range lands. Otherwise the rains had little effect.

Weather in the Upper San Joaquin Valley favored crops and harvesting operations. Lack of rainfall during the first 18 days sustained cotton grades and yield. Rains from the 19th to 22nd temporarily curtailed some harvesting operations but started a good growth of pasture and range grasses.

Grasses in the Santa Maria area started to grow as a result of rains late in October but were in need of additional moisture. Otherwise weather conditions were ideal for crops. Rains during the third week briefly interrupted harvesting of carrots and late potatoes but benefited pasture and range grasses.

High temperatures and low relative humidities in the Los Angeles area during the first week contributed to interruption of pest control operations and rapid depletion of soil moisture. Rains on the 19th and 20th relieved the drought and water shortage somewhat, and top soil moisture was generally ample for germination of grains and cover crop seed. Temperature fluctuation during the latter portion of the month aided coloring of Navel oranges.

In the San Diego area celery grew rapidly due to rains of late October, and truck crops continued in good condition. Warm weather during the month favored maturing of avocados and prolonged the tomato harvest. Low relative humidities on some days resulted in interruption of spraying operations. Rains from the 19th to 24th benefited crops, with the exception of some tomatoes which sustained some damage. Mountain ranges started to turn green.

Weather in the Imperial Valley was generally favorable for all crops and farming operations.

HHE

STATIONS NOT FOLLOWED BY A TABLE NUMBER REFERENCE IN THE STATION INDEX ARE NOT PUBLISHED IN CLIMATOLOGICAL DATA BEGINNING WITH OCTOBER 1951, RECORDS.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

DECEMBER 1951
Volume LV No. 12

SAN FRANCISCO: 1952

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 313 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 43.2° or 2.4° below the weighted mean. The unweighted average based on the same 313 stations was 43.8° or 1.9° below the unweighted mean. The highest temperature, 80°, was recorded at Borego Valley on the 1st and El Cajon Yale Ranch on the 3rd. This was the lowest value of the highest temperature for the State recorded since 1897. The previous lowest value of the highest temperature for December, 82°, occurred at El Cajon on December 14, 1920 and La Mesa on December 14, 1936. The lowest temperature, 31° below zero, occurred at Boca in Nevada County on the 31st. Only once since 1897 has a temperature of 31° below zero or lower been recorded in California in December. The lowest, 36° below zero, was recorded at Portola on December 12, 1919.

The average precipitation for the State based on 318 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 7.13 inches or 3.46 inches above the weighted mean. The unweighted average based on the same 318 stations was 7.83 inches or 3.71 inches above the unweighted mean. Based on 541 stations listed in Table 3 the unweighted average precipitation was 8.19 inches or 4.07 inches above the unweighted mean. The greatest monthly total precipitation, 27.57 inches, was reported from Inskip Inn in Butte County. The greatest daily total, 6.85 inches, was recorded at Lake Arrowhead in San Bernardino County on the 30th.

Measurable snowfall was reported from 86 stations. Soda Springs at an elevation of 6752 feet in Nevada County reported the greatest snowfall, 170.0 inches. Three other stations also received over 100 inches of snowfall: Cisco Ranger Station, 113.8 inches; Tahoe, 106.0 inches; and Twin Lakes, 144.0 inches. For a comparison of total monthly snowfalls and greatest depths on ground for selected stations for December for period 1926-1951, see Table of Comparative Snowfalls and Greatest Depths on Ground for December on Page 396 of this bulletin.

Heavy rains in the north coastal area during the first five days brought farm work to a virtual standstill. Grasses on ranges were slowed considerably due to snow and cold weather.

Rains during the first week in the central coastal area interrupted farm work; such as cultivating, pruning, spraying, etc. Grasses and cover crops benefited from the rains. On the 1st lightning virtually demolished an unoccupied cabin near Lakeport in Lake County. In Oakville in Napa County, on that same day, strong winds downed a giant eucalyptus tree which crushed the corner of a dwelling. One room was sheared off, and a one-year old child in an adjacent room was injured as a result of the falling tree. Whole gale winds on the 1st afforded the first major test of stress and strain on the span of the Golden Gate Bridge since it was opened in May 1937. Traffic was halted on the bridge for almost three hours as the massive span swayed. As a result of the wind, repairs were necessary in the expansion joint guide assembly of the floor system where wear and tear of the traffic occurred. The strains sustained were far less than the bridge was designed to withstand it was reported. In San Francisco on the 3rd, a $25,000 home tumbled down the side of a hill and collapsed after its foundation had been weakened by water from a broken storm sewer. Elsewhere, trees were uprooted, trolley wires downed, traffic slowed, windows smashed, basements flooded, etc. In Berkeley strong winds forced a huge tree down, smashing two parked cars. Radio Station KPFA in Berkeley went off the air when gusty winds knocked off its 105-foot tower smashing its $3500 antenna. Down the peninsula, Burlingame was hardest hit. Flood waters filled streets and marooned shoppers. Some subdivisions along Bayshore Highway were hard hit by the rising waters. Low temperatures from the 6th to 10th aided in bringing trees into dormancy in many districts. Heavy rains during the last week generally curtailed farming operations such as spraying of prune orchards, etc. Grains in some Sonoma County districts manifested some yellowing in some spots due to excessive moisture.

Rains during the first four days in the Upper Sacramento Valley interrupted plowing and seeding operations. As most of the moisture soaked into the soil it was very beneficial to grains, pastures, and ranges. Generally mild weather from the 5th to 25th was helpful for pruning and spraying operations and for tilling soil for winter grains, but below normal temperatures at times slowed growth of grasses and winter grains. Heavy rains on the 25th, 26th, and 27th melted snow in mountains and brought all streams up to bankfull stages. The Sacramento River rose above bankfull stage on the 27th at Red Bluff. Most livestock were moved to higher ground although some were cut off and left stranded by rapidly rising waters. Farming operations were again halted by the rains.

Heavy rains in the Lower Sacramento Valley during the first week interrupted harvesting activities and saturated soils. Small amounts of unharvested sugar beets and rice remained. Cold weather at intervals contributed to complete defoliation of orchards and vineyards and induced dormancy. A general respite from the rains during the second week permitted soils to dry sufficiently for digging of remainder of the sugar beet crop. Rains during the last week generally curtailed any field work; however, some seeding and pruning was accomplished on sandy hills.

Ranges in the Lower San Joaquin Valley continued to improve following the rains early in the month. The second picking of cotton was held up most of the month due to rains and below normal temperatures but progressed in short periods of warm, sunny weather. Heavy frosts were reported on seven days at Fresno; however, citrus was virtually undamaged. New record low temperatures were established at Fresno on the 9th and 10th. The maximum temperature at Fresno on the 27th, 67°, exceeded the previous maximum for that date at that station. Rains during the last week benefited ranges but slowed farm work.

Since cotton was about 85 percent harvested in the Upper San Joaquin Valley overall losses from rains of the first week were light. Frosts during the second week stopped growth of most crops. Minimum temperatures on the 9th and 10th were unusually low for so early in the season. Rainfall at Bakersfield for December was the greatest since 1936.

Rains in the Santa Maria area during the first week benefited grasses. Frosts during the second week resulted in some damage to artichokes, celery, and endive. Cool weather during the month slowed growth of grasses.

Rains during the first five days in the Los Angeles area were very beneficial for crops but the cold spell which followed was detrimental. New citrus growth sustained some damage. Orchard heating was reported heavy on the 8th, moderate on the 9th, and light in coldest districts on the 10th. Considerable damage to ornamental shrubs and flowers was sustained throughout metropolitan districts. "Santa Ana" winds during the first week resulted in some drop and scarring of citrus fruits mostly in Orange County. Strong winds in the San Fernando Valley and foothill areas resulted in some damage to trees, power lines, windows, television antennae, etc. In the Beaumont district strong winds on the 9th, 10th, and 11th damaged many roofs and television antennae. In Cherry Valley an entire roof was blown off. In Banning gale force winds damaged private homes and blew out one end of a hangar at the airport. Dust plagued housewives as it sifted in through every possible crevice. Heavy rains in the Los Angeles metropolitan area and southwest section, Downey, Venice and Van Nuys from the 28th to 30th brought damage from accumulation of water in the low flat districts. Buildings, homes, and automobiles were partially inundated in many instances. Losses in buildings, automobiles, merchandise, home furnishings, etc., were estimated at $80,000. Heavy snowfall drifting in the San Bernardino Mountain area on the 30th stranded many motorists from Crestline to Big Bear Lake. Rains brought a flash flood cascading down the east slopes of the San Jacinto Mountains and washed out a portion of highway east of Palm Springs. On the Pacific Coast Highway near Malibu heavy rains during the last week resulted in numerous rock slides.

Winds and rains in the San Diego area during the first week ended the tomato season which was unusually long this year and resulted in losses to the tomato crop estimated at $500,000. Winds also damaged some avocado fruit and trees at Escondido and caused scattered damage to power and telephone lines. Ranges and pastures benefited greatly from the rains and oats and barley were expected to make one of the best crops in years. Subfreezing temperatures on the 8th and 9th caused light damage to citrus and avocados in low districts, but seriously injured squash, peppers, tomatoes, and string beans growing on low grounds. At San Diego new low temperature records were established for the 8th and 9th.

Weather in the Imperial Valley was generally favorable for growth of crops and farming activities.

HHE

CORRECTED DATA

DECEMBER 1950	Table 2, State average precipitation departure should be (+) .52.
ANNUAL 1950	Oakville 1 W, precipitation annual total should be 43.94.
MARCH 1951	Vollmers, delete temperature record.
JUNE 1951	Boca, Table 6, evaporation on 19th should be .34 and 20th, .28.
	Imperial, Neenach and Twentynine Palms, precipitation departure should be .00.
JULY 1951	Florence Lake, see Delayed Data Table 3 and 4 for corrected data.
AUGUST 1951	Los Banos, add the following max. temperatures, 22nd through 30th; 90, 90, 92, 99, 102, 94, 84, 86, 86. Min. temperature on 9th should be 52 and 16th, 63. Mean max. should be 96.3, mean min., 56.4, monthly mean 76.4, departure -1.7, total degree days 0 and max. 90 or above 27.
AUGUST AND SEPTEMBER 1951	Madera, delete all min. temperatures.
SEPTEMBER 1951	Turlock, delete precipitation on 4th, should be no precipitation and monthly total Trace.
NOVEMBER 1951	Nicolaus, monthly precipitation total should be 2.04.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 2, 3, 5, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

' Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing. See Table 5 for detailed daily record. Monthly totals if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CORRECTED DATA WILL BE FOUND ON PAGE 401.

ANNUAL SUMMARY 1951

Volume LV No. 13

SAN FRANCISCO: 1952

E. L. Felton, Section Director, San Francisco

WEATHER SUMMARY

In 1951 light precipitation characterized the late winter period of February and March. Warm weather was notable throughout the Central Valley and southern California in September. Heavy rains brought precipitation above normal in northern California during October and November. Unusually wet, cold weather throughout the State and heavy snowfalls in the Sierra Nevada characterized December.

Property was damaged in the Sunnyvale-San Jose district by a tornado on January 11, 1951. Strong winds in southern California and a flood in the north coastal area resulted in damage to property. Drought in southern California during March was detrimental to growing farm crops and resulted in heavy irrigation. By April the lack of adequate precipitation in northern California had reached serious proportions and had resulted in considerable deterioration of grains and grasses. Heavy rains in the Imperial Valley in August brought damage to roads and irrigation canal systems. Warm weather during September favored crops and harvesting operations. The lack of early rains in October permitted harvesting of a large proportion of the sugar beet crop in the Sacramento Valley. Rains during November and December generally benefited grasses and other growing crops but interrupted harvesting operations. Heavy rains and flooding in December resulted in losses to property in the Los Angeles and San Francisco Bay areas.

SYNOPSIS BY MONTHS

Temperatures during JANUARY averaged generally much above normal in the extreme southeastern portion of the State, near normal in the central coastal area and above normal elsewhere. Heavy precipitation obtained in extreme northern portions and the southeast desert region, light precipitation in the central coastal and lower Sacramento Valley, and moderate precipitation elsewhere. Heavy rains over the Eel River Basin on the 21st brought the Eel River to almost six feet above flood stage with considerable property damage. On the 11th a small tornado struck the Sunnyvale-San Jose district with damage to property estimated at $1,500,000. Also on the 11th strong winds in the Torrance district of Los Angeles County caused damage to oil well derricks, power lines, etc., estimated at $100,000.

FEBRUARY temperatures averaged generally above normal in southern California and the upper San Joaquin Valley and near normal elsewhere. Precipitation was heavy along the north coast, generally light in southern California and the upper San Joaquin Valley, and moderate in other areas. A severe cold period occurred in the San Joaquin Valley and some southern portions during the 1st and 2nd. Heavy rains on the 3rd and 4th over the Eel River Basin brought the Eel River over its banks for the 4th time this season. From the 4th to 6th moderate rains in the lower Sacramento Valley resulted in sharp rises in the Feather and American River tributaries and smaller rises along the Stanislaus and Cosumnes Rivers.

During MARCH temperatures averaged generally below normal in northern portions and the Central Valley and near normal elsewhere. Moderate precipitation occurred in the north coastal area, lower Sacramento Valley, and south coastal area, and light precipitation in other sections. March precipitation was the third lowest on record at Red Bluff. Frosts during the first portion of the month damaged some truck crops and nipped some fruit in the lower Sacramento Valley. The minimum temperature in Sacramento on the 3rd, 31°, was the lowest on record for that date and within two degrees of the lowest temperature on record for March for that station. Since no measurable precipitation fell in Sacramento after the 6th, the longest March drought since 1934 occurred. The absence of rainfall in the lower San Joaquin Valley permitted increased activity in cultivation of soils but was unfavorable for grains and grasses. At Fresno precipitation was the least since 1944 and the sixth lowest since 1900. The lowest temperature ever recorded at Fresno in March occurred on the 3rd when the mercury dropped to 27°. In the Los Angeles area drought conditions reached serious proportions by the end of the month when nearly all grains had deteriorated to near total loss estimated at 100,000 acres of dry-farmed land. By the end of the month irrigation was in progress on a near summertime schedule. At San Diego, March was the driest since 1934.

In APRIL much above normal temperatures obtained in the northeastern portion of the State, near normal temperatures in the north and central coastal areas, and generally above normal temperatures elsewhere. Precipitation was light in the north coastal area, moderate in the Sacramento Valley, and heavy in the Sierra Nevada and other portions of the State. The April snowpack in the Sierra Nevada was generally below normal. The lack of adequate precipitation in northern California was extremely unfavorable for grains and range grasses. Considerable grain deteriorated beyond recovery. At Sacramento the longest early spring drought of record, 52 consecutive days without measurable precipitation, ended with a moderate rain on the 28th. The 92° maximum temperature in Sacramento on the 10th was the highest temperature ever recorded so early in the season at that station. Relative humidities as low as 12 per cent accompanied the warm weather. Hail on the 28th and 29th resulted in losses to fruits and other crops in the lower Sacramento Valley and east side of the lower San Joaquin Valley. The lack of adequate precipitation in the upper San Joaquin Valley and southern California in March and April resulted in virtually a complete loss of unirrigated grains.

MAY temperatures averaged generally much above normal in the Sacramento Valley and the San Francisco Bay area and above normal in other areas. Heavy precipitation occurred in the upper Sacramento Valley and northeastern interior, light precipitation in the southern one-third of the State, and moderate precipitation elsewhere. Rains during the first part of May in northern California benefited some late planted grains but resulted in some damage to cut alfalfa and ripening fruits. Cool, unsettled weather in the Central Valley early in the month generally retarded development of berries and tomatoes and contributed to considerable necrosis and weakening in cotton plants. Unusually high temperatures occurred in the Central Valley during the last week.

Temperatures in JUNE averaged generally from above normal to much above normal in the northern one-half of the State and generally from near normal to below normal in the southern one-half. Precipitation was moderate to heavy over the Sierra Nevada, central coastal area, San Joaquin Valley and San Bernardino, Mono, and Inyo Counties, and light elsewhere. Weather during June was generally favorable for crops and farming activities.

In JULY much above average temperatures obtained in the extreme southeastern interior, below to much below normal temperatures from the San Francisco Bay region to the Los Angeles area, and near normal to above normal temperatures elsewhere. Precipitation was heavy in the southern portion and the southeastern interior and generally light in other areas. In the Central Valley below normal temperatures during the first portion of the month slowed development of crops. The minimum temperature of 51° recorded at Fresno on the 4th established a low temperature record for that date at that station. Higher temperatures during the third week favored crops. A hot spell between the 17th and 19th established new records for high temperatures at San Diego for those dates.

AUGUST temperatures averaged from near normal to above normal in the southeastern interior, near normal in northern portions, and below normal elsewhere. Light to moderate precipitation occurred in the north coastal area, Central Valley, and Sierra Nevada and heavy precipitation in other areas. Weather during the month was generally favorable for crops. A thunderstorm in San Francisco on the 21st disrupted some power and light services in various parts of the city and brought the accumulated total precipitation since July 1, 1951 to 0.44 inch or the greatest accumulated total for that period since records began in 1849 at that station. Heavy precipitation occurred in southern California. The total precipitation at Los Angeles was the fifth greatest of record for August. Total precipitation at San Diego for August was exceeded only three times since records began in 1850. Thunderstorms in the Imperial Valley during the last week brought heavy rains and resulted in damage to roads and the Imperial Irrigation Districts's canal systems.

Much above normal temperatures obtained throughout the State in SEPTEMBER except for near normal to above normal temperatures along the coast. Precipitation was heavy in southern portions, the San Francisco Bay region, and lower Sacramento Valley, and moderate to light elsewhere. The exceptionally warm weather generally favored crops and harvesting activities. The twenty days from the 8th through the 27th established a new record at Fresno for the greatest number of consecutive days with above normal daily maximum temperatures during September. The highest temperature of the summer at Bakersfield, 107°, was recorded on the 16th. At San Diego a noteworthy feature of the weather

(Continued on Page 424.)

MAX AND MIN IN TABLE 4 REFER TO MEAN MAXIMUM AND MINIMUM TEMPERATURES OF WATER IN PAN.

WEATHER SUMMARY (Continued)

was the large number of days with fog. Eight days with fog were recorded compared to the average of only two for September.

OCTOBER temperatures averaged generally from near normal to below normal in the interior and from above normal to much above normal in coastal and southern portions. Heavy precipitation obtained in northern California and moderate amounts in the San Joaquin Valley. Average daily temperatures on the 7th, 8th, and 9th at Los Angeles were from 12° to 14° above normal. Irrigation water requirements were increased, pest control operation interrupted, and fire hazards increased. Heavy rains during the period from the 23rd through the 25th brought the average for the State above normal. Rain on the 24th ended a 127-day period without precipitation at Fresno. The lack of early rains permitted digging of over half of the sugar beets in the lower Sacramento Valley without interruption. In the upper Sacramento Valley rains on the 23rd and 24th generally wetted soils sufficiently to permit large-scale tilling and planting operations.

Precipitation in NOVEMBER was generally heavy throughout the State. Temperatures averaged much above normal in the central coastal area and generally above normal elsewhere, except in northern portions where near normal to below normal temperatures obtained. Rains generally interrupted harvesting activities but benefited pasture and range grasses. Above normal temperatures contributed to a generally excellent development of grasses and other growing crops where precipitation was adequate.

Temperatures in DECEMBER averaged generally below normal in the upper Sacramento Valley and other northern portions and generally near normal elsewhere. Precipitation was generally heavy except in the upper San Joaquin Valley and southeastern interior where only moderate amounts occurred. Heavy rains generally interrupted harvesting activities but benefited grains and grasses. In the San Francisco Bay area flash floods occurred in some business sections. Heavy rains in the upper Sacramento Valley on the 25th, 26th, and 27th, melted snows and brought all streams to bankfull stages. From the 28th to the 30th, inclusive, heavy rains in the Los Angeles metropolitan area resulted in losses to buildings, automobiles, merchandise, home furnishings, etc., estimated at $80,000. Strong winds in some districts during the month resulted in considerable damage to structures, power lines, television antennae, trees, etc.

Reactivated.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

- No record.
+ Also later date (dates) or months.
• Amount included in following measurement, time distribution unknown.
// Gage is equipped with a windshield.
D Adjusted to full month.
E Water equivalent of snowfall wholly or partially estimated, using a ratio of 1 inch of water equivalent to every 10 inches of new snowfall.
M 1 to 9 days' record missing; see monthly Climatological Data for detailed daily record.
R Station equipped with a recording gage only.
T Trace, an amount too small to measure.
V Includes total for previous months. V in annual column means total is for a two-year period.
S Storage precipitation station. Will be published in the June, July and August or delayed data December issue of Climatological Data.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1952

CALIFORNIA - JANUARY 1952

E. L. Felton, Section Director, San Francisco

WEATHER SUMMARY

The average temperature for the State based on 307 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 41.1° or 3.1° below the weighted mean. The unweighted average temperature based on the same 307 stations was 41.8° or 2.4° below the unweighted mean and equaled or exceeded in 45 out of 55 Januarys since 1897. The highest temperature, 81°, at Santa Ana on the 28th, was equaled or exceeded in 52 out of 55 Januarys. The lowest temperature, 39° below zero, occurred at Boca in Nevada County on the 1st and was the second lowest January extreme on record.

The average precipitation for the State based on 308 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 7.66 inches or 3.68 inches above the weighted mean. The unweighted average based on the same 308 stations was 8.57 inches or 4.03 inches above the unweighted mean and equaled or exceeded only four times since 1897. Based on 536 stations listed in Table 3 the unweighted average was 9.43 inches or 4.89 inches above the unweighted mean. The greatest monthly total, 28.09 inches was recorded at Juncal Dam in Santa Barbara County. The least monthly total, 0.30 inch, occurred at Blythe in Riverside County. The greatest daily amount 13.21 inches was recorded at Juncal Dam on the 15th.

The greatest monthly snowfall, 195.5 inches, occurred at Tahoe, and the greatest depth on the ground, 215 inches, at Soda Springs on the 26th. Snowfalls and maximum depths of snow on ground for many stations since 1921 are given in Table of Comparative Snowfalls and Maximum Depths on Ground on Page 19.

Cold weather in the North Coastal area during the first two decades greatly retarded the growth of grasses and resulted in some losses in lambing.

Cool weather during the first two decades in the Central Coastal area was favorable for keeping fruit and nut tree buds from developing. Frosts restricted growth of grasses, and frequent rains kept most farm work at a standstill. On the 12th more than 2000 persons fled their homes as heavy rains and floods menaced low-lying districts in the East Bay area, the Peninsula and Marin County. The overflow from Laurel Creek in San Mateo lapped at hundreds of homes in San Mateo Village. Garages were flooded, and many sidewalks and lawns inundated. A number of schools were closed, and doorways of business establishments were sandbagged. Numerous slides threatened homes and interrupted traffic. Hundreds of acres of farm lands were flooded damaging some of Alameda County's cauliflower crop. In Sebastopol a couple narrowly escaped injury when strong winds downed a 110-foot fir tree on the roof of a 5-room bungalow. Many television antennas were ripped down, and many power failures reported due to the gale winds. In Contra Costa County five creeks overflowed as a result of heavy rains from the 12th-15th. Concord was threatened by floods when a 60-foot section of the concrete lining of the Contra Costa irrigation canal broke loose and wedged itself across the waterway three miles east of Concord.

In Santa Clara County heavy rains and strong winds from the 12th to 15th resulted in major power failures and flooding in many districts. Families were evacuated from many homes which were flooded. All but 25 of Alvisos' 700 population were forced to leave their homes or were evacuated as the worst flood on record resulted in waters inundating the town. In the Los Gatos district strong winds uprooted trees and raised havoc with roofs. Damages estimated between $4,000 and $5,000 were sustained by the new Multiple Copy Forms Company building when the entire tar paper covering on the plant blew off. Greatest losses were felt in inventory stock. In Eureka Canyon, Santa Cruz County heavy rains resulted in numerous slides and fallen trees, blocking the Eureka Canyon road. Canyon residents were marooned for about a week behind the slides.

In the Upper Sacramento Valley low temperatures during the first two decades generally restricted growth of grains and grasses. Frequent rains held most farming activities at a standstill.

Farm work in the Lower Sacramento Valley generally remained at a standstill due to rains. Some flooding occurred in low spots. Heavy snowfall and strong winds from the 10th to 15th throughout the Sierra Nevada and some other portions of northern California brought heavy damage to electric power and telephone systems. Snow-weighted power lines snapped; high winds whipped telephone lines into a snarl; slides downed poles and high tension towers. Near Donner Summit heavy snowfall trapped the Southern Pacific's streamliner, City of San Francisco, for about a week. The road was closed on the 13th with 210 inches of snow on the ground at Norden. The train was stalled by a small slide ahead of the train and then snowed in before it could get moving again. On the 16th passengers were removed, and on the 19th the train was pulled out with the line opened only for limited operations. This was the first tie-up of this road due to snowfall since the winter of 1889-90 when it was closed for two weeks. At Twin Bridges about 40 miles east of Placerville, a heavy deposit of snow began slipping along the granite slope above the resort building (store, post office). It picked up momentum carrying with it top soil, brush, etc., and swelled into an avalanche roaring down upon the building. The structure collapsed. Two persons were trapped and killed in the building. Washington in Nevada County was cut off from supplies with three residents in desperate need of medical care with no physician in the community. Two houses collapsed under the weight of accumulated snow and a third burned to the ground because no water was available to fight fire. Heavy snow during the period from the 12th to the 16th, inclusive, left Chester and Westwood with one of the deepest snowfalls of record. In addition to the heavy snow, gale winds drifted the snow to block all roads to Chester and Westwood. It was the wind that cut off communications, disrupted power service, and stranded snow plows in heavy drifts. In Truckee, Nevada County snow stood ten feet deep in the streets isolating residents one from the other and creating quite a problem in the distribution of fuel oil and other necessities. Heavy snows drifted and blocked Highway 40 for days. Since 1931 when the State Division of Highways committed itself to keeping Highway 40 open all year there have been intermittent closings. In the winter of 1937-38 snows kept the road closed for 10 days. In Sacramento, January was the wettest since 1916. At Norden in the Sierra Nevada the maximum snow depth, 218 inches, on the 17th was the greatest depth so early in the season since daily records began in 1898.

A prolonged cold spell early in the month in the Lower San Joaquin Valley accompanied by subfreezing temperatures made orchard heating necessary in citrus groves. Grains and grasses were slowed by the low temperatures but assisted by rains. Unsettled weather kept most farming operations at a minimum. Heavy rains on the 24th and 25th virtually stopped all farming operations. Practically all cotton had been picked, but baled cotton lying in fields sustained some damage, particularly from mud splashed on bales near the ground.

Below freezing temperatures in the Upper San Joaquin Valley made some orchard heating necessary for citrus, during the first week. Rains during the month favored grasses, but low temperatures during the first portion of the month restricted growth. The total precipitation at Bakersfield, 2.47 inches, was exceeded only four times since records began in 1889 at that station.

Rains and low temperatures in the Santa Maria area kept truck planting activities at a virtual standstill during the first two decades. Endive and celery sustained some damage, and growth of broccoli was slowed due to the cold weather. Rains resulted in a considerable flow of water in the Santa Maria River which had been an arroyo for several years. One farmer who had been using the river bed itself for crops was washed out. Hill pasture progressed satisfactorily. Precipitation at Santa Maria was over three times the ten-year average for January.

Below freezing temperatures in the Los Angeles area required orchard heating on the 2nd, 3rd, and 4th. Cold, wet weather during the second week delayed navel orange picking and generally restricted growth of all crops including grasses. During the period of the 15th-16th some homes were flooded in the Riverside district due to heavy rains. Two adobe houses in Casa Blanca collapsed as rains weakened their foundations. Some schools were dismissed due to high water around buildings and some flooding inside. In the Los Angeles metropolitan area heavy rains and strong winds, flood water, erosion, land slides and silting from the 15th to the 18th, inclusive, resulted in damages estimated at $3,700,000. Most severe damage occurred in Van Nuys, Reseda, Downey, Artesia, Hawaiian Gardens, Compton, Lynwood, Southgate, Lakewood and Norwalk. Damages were itemized as follows; buildings - $1,000,000; automobiles - $100,000; household furnishings - $700,000; merchandise in stores - $300,000; highways, gridges, etc. - $1,500,000; crops-

DATA FOR THE PERIOD BEGINNING WITH OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ON AN AREAL BASIS AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

WEATHER SUMMARY (Continued)

$100,000. Ten persons lost their lives as a result of the storm. During the last decade grains, grasses, and cover crops made rapid growth due to the higher temperatures and plentiful soil moisture.

Subfreezing temperatures in the San Diego area during the first week resulted in some damage to truck crops and unprotected citrus and avocados on low ground. From the 13th to the 18th, inclusive, heavy rains and flooding in San Diego County and vicinity resulted in losses of about $500,000. Housing units built on low ground sustained the greatest damage. At the peak of the flood conditions on the night of the 17th, 100 persons were reported forced from their homes. Hundreds of homes were in need of repairs, and newly graded streets were eroded as a result of the rains and flood waters. Along the Tia Juana River approximately 700 persons were evacuated from homes along the banks. One person lost his life as a result of high waters. Strong winds resulted in some fruit blown from trees and some slight scarring of fruit in citrus and avocado groves. In newly prepared fields erosion was reported quite heavy.
